

This set does not contain body shell, tires and wheels. Please prepare them individually.

Also, please prepare 4pcs of AA / LR6 batteries for transmitter.

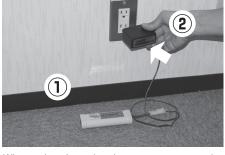

* Please read before start running the car. *

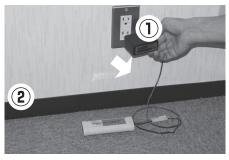

Battery and AC quick chargers

Battery included in the set is 1400mAh Ni-cd type. Charge the battery with charger before running the car.

**For your safety, please follow the precautions for handling the charger and Ni-Cd battery.

When charging the battery, connect the battery to quick charger, then plug the charger into an outlet. It will take about 70 minutes to fully charge the supplied battery.

When charging is completed, first unplug the charger, then remove the battery.

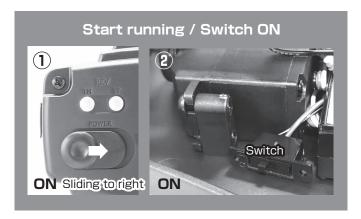

●How to use transmitter

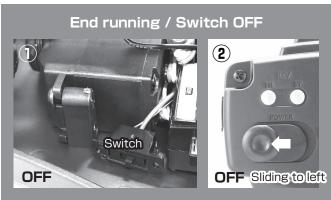

First, insert four AA / LR6 batteries into the transmitter. When running the car, be sure to turn on the power switch of the transmitter first and then turn on the power of the car. If you don't follow this procedure, there are possibility that car will run out of control and is dangerous.

Check the steering and throttle neutrals before driving. Make sure that steering wheels are to run straight, and throttle position are in neutral that motor does not start moving when not operating.

*When turning on the switch on the car side, keep the tires away from the road surface. Since it might become very dangerous that car might run involuntarily when a neutral shift occurs.

When starting and ending the run, follow steps ① to ② below.

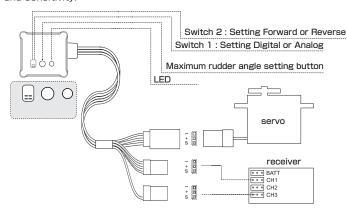

Gyro Sensors

Initial Setting on switches

Switch 1 : Analog Switch 2 : Reverse Volume Rate : 50%

Wiring connection diagram and set, diagram of adjustment part

Use the plastic screwdriver included in the set to adjust the switch and sensitivity.

- Gyro need to be fixed with double sided tape in flat area of upper deck or main chassis.
- •Switch 1 (Right side): There are two types of signals that the servo moves: analog and digital. The set at the time of purchase is in the digital mode used by many people. If the servo does not respond, set the switch up to make it analog.
- •Switch 2 (Left Side): Setting the operating direction of the servo with the gyro. The set at the time of purchase is reversed and is set on the switch. If try turning the steering wheel before driving and the servo does not move in the counter direction, set the switch 2 to the lower / forward rotation again.

- Driving procedure and maximum rudder angle setting

 ①Place a bodyless car with a gyro on a flat table or ground.
- ②If turning on the power without the body, the gyro LED will be
- blinking fast. This is a sign that detects gyro neutral and steering neutral. Do not move the vehicle body or steering wheel during detection.
- $\ensuremath{\mathfrak{I}}$ If the LED stops blinking and stays on, it is a sign that the neutral setting is completed.
- ①However, if the fast blinking of the LED does not change to lighting and then changes to slow blinking, it is a sign that the normal neutral setting has failed to complete, so start over again from ①.
- §Turn the steering wheel to the right on the transmitter side, press the switch briefly at the point where it hits the steering stopper, the red-blue light blinks twice at high speed, then blue lights up, and red lights up slowly indicates that the setting has been saved.
- ⑥Next, as same with the right side, press the switch briefly at the point where it hits the stopper. The red-blue light blinks twice at high speed, and then the red-blue lights turn on at the same time, it indicates that the second setting has also been saved.
- $\ensuremath{{}^{^{\circ}}}$ The steering is set to neutral and the gyro endpoint setting is completed.
- *This product cannot be used if the 3rd channel of the transmitter is push button type.
- *When adjusting the endpoint, adjust it within the range where the load is not applied to the servo. Please note that when a load is applied to the servo, a load sound will be generated from the servo.

Initial Settings are installed as

" * " marked on Mode Parameter table.

Yokomo Speed Controller (ESC) SCR-BR Instruction Manual

■ SPEC

- 1. Input voltage: 7.2V to 8.4V (Ni-cd / Ni-MH), 7.4V (Li-Po), 6.6V (Li-Fe)
 - 1. Number of Ni-cd / Ni-MH cells 6 to 7 (7.2V / 8.4V)
 - 2. Number of Li-Po cells: 2 (7.4V) 3. Number of Li-Fe cells: 2 (6.6V)
- 2. Output voltage: Forward continuous maximum current 70A Instantaneous maximum current 500A / 10 seconds, Reverse continuous maximum current 100A (FET specified)

Steady current (forward): 5 minutes / 70A, 30 seconds / 80A, 1 second / 106A

Steady current (backward): 5 minutes / 35A, 30 seconds / 40A, 1 second / 53A

- 3. Maximum output current: 504w BEC 5V 1A (maximum 1.5A)
- 4. Size / Weight: 3.4mm x 34.5mm x 27.5mm / 50g
- 5. Available turns: 15 turns or more [≤ 7.2V (Ni-MH 6 cells)], 17 turns or more [8.4V (Ni-MH 7 cells)]
- 6. Pulse frequency: 1KHz

■ Battery voltage automatic cutoff setting

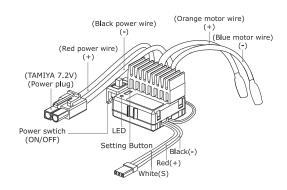

Battery Volt	7.2V	7.4V	6.6V	
AUTO	Initial setting voltage × 70%			
Ni-cd / Ni-MH	5.4V	-	-	
Li-P0	-	6.5V	-	
Li-Fe	-	-	4.8V	

* Please set in the ESC setting.

■ ESC Overheat protector

** In this case, stop driving immediately and turn off the ESC switch.

■ ESC wiring diagram

The receiver connector connects to CH2. The polarity matches Sanwa, KO and Futaba receivers. Check the polarity for other brands of receivers before plugging in.

■ Throttle Neutral setting

Connect the battery and motor to the ESC.

2 Turn on the power in the order of transmitter to ESC.

3 ESC sounds and the neutral setting starts automatically.

When the neutral setting is complete, the ESC will make another sound.

- * Do not operate the throttle on the transmitter until the neutral setting is completed.
- * Depending on the transmitter manufacturer, forward and reverse may be reversed when the neutral setting is made. In that case, change the slot reverse switch of the transmitter from normal to reverse setting.

	Neutral	Forward	Full Throttle	Brake	Full Brake	Reverse	Full Reverse
LED lamp	Yellow	Red blink	Red	Red slow blink	Red	Red slow blink	Red

■ Caution

- 1. After driving, ESC is hot around heatsink and motor case, so don't touch it.
- 2. Always use connectors and wires with good current ratings. Replace the original ESC connector, or extend the connecting wire to make adjustments to avoid poor connector contact, melting due to overheating, and abnormal power cutoff.
- 3. Connect the battery just before driving and disconnect it after driving. Also, do not solder the battery directly to ESC, use the appropriate connector in between.
- 4. Always connect a power source with the correct voltage and polarity to the ESC. Using power sources with different voltages or polarities can damage the ESC. Also, do not solder the ESC wire directly to the battery, be sure to use a connector in between.

■ ESC Setting * For experts

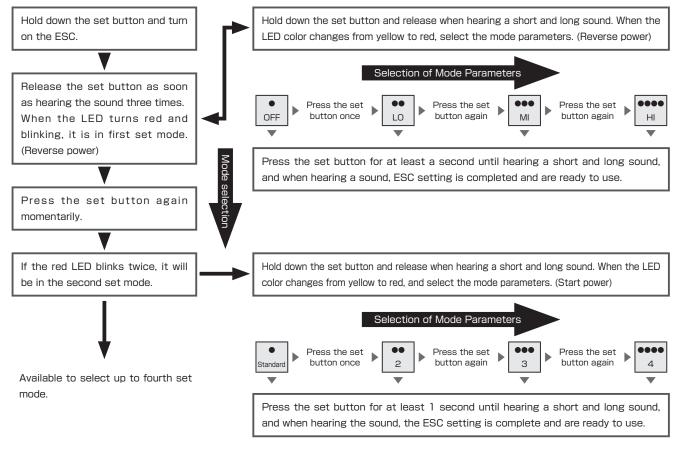

LED display: [Red] Selection of setting mode [Yellow] Selection of mode parameters

Detailed settings: (\bullet number of blinks \bullet = 1 time \bullet \bullet = 2 times \bullet \bullet \bullet = 3 times \bullet \bullet \bullet = 4 times)
